Abstract

bit is a collection of small scripts and programs that facilitate many common tasks in bioinformatics. It operates in a Unix-like command-line environment and is comprised of bash and python code. bit is openly available on GitHub, archived with Zenodo, and is conda installable. The package is useful for users who want to do things such as manipulate fasta files, calculate GC content, quickly summarize nucleotide assemblies, easily download assemblies from NCBI just based on accessions, pull amino-acid sequences from GenBank files, calculate Shannon uncertainty for columns in multiple sequence alignments, and more. The source code is hosted on GitHub: github.com/AstrobioMike/bit

Introduction

There are of course several great and widely used packages of bioinformatics helper programs already available. Some of these include the likes of seqtk, fastX-toolkit, and bbtools – all of which I use regularly and have facilitated goals I was trying to accomplish. But there are always more tasks that crop up that may not yet have a helper program or script already written to accomplish them. \textit{bit} is a collection of small scripts and programs that were not written for any single piece of research work. Rather it is a collection that has been built (and is still being built) over several years. Anytime I need to write something to perform a task that has more than a one-off ad hoc use, something I end up using frequently, I consider adding it to the \textit{bit} package. Some programs are light wrappers that extend and/or simplify the utility of existing software (like taxonkit and goatools); many are written in Python leveraging the Biopython module (e.g. programs to summarize assemblies, calculate gc content, calculate Shannon uncertainty per column in multiple sequence alignments, pulling amino-acid sequences from GenBank files); and many are bash scripts to do things like download any assembly in

```bash
# looking at help menu
$ bit-dl-ncbi-assemblies -h

HELP INFO

This program downloads assembly files for NCBI genomes. It takes as input assembly accessions (either GCA_* or GCF_*) and optionally a specification of which format to download. For version info, run 'bit-version'.

Required input:
- [-w <file>] single-column file of NCBI assembly accessions

Optional arguments include:
- [-f <str>] default: genbank
  Specify the desired format. Available options currently include: genbank, fasta, protein, gff, feature_tab, report, stats.
- [-j <int>] default: 1
  The number of downloads you'd like to run in parallel. Write speeds can become problematic generally with around 15 or more, so a max of 12 will be used to be safe even if more are requested.

Example usage:

```
bit-dl-ncbi-assemblies -w ncbi_accessions.txt -f protein -j 4
```

```bash
# creating an input file holding the wanted accessions
$ printf "GCF_000005845.2\nGCA_000008865.2\n" > wanted-accessions.txt

# viewing file just made
$ cat wanted-accessions.txt
GCF_000005845.2
GCA_000008865.2

# running program
$ bit-dl-ncbi-assemblies -w wanted-accessions.txt -f fasta -j 2

Targeting 2 genomes in fasta format.

DONE!

# viewing new output files
$ ls *.gz
GCA_000008865.2.fa.gz GCF_000005845.2.fa.gz
```

Figure 1. Example accessing the help menu and using the program for downloading genome assemblies from NCBI.
different file formats from NCBI just by providing a list of wanted accessions. It is a rather random collection, but it is of convenience to many users.

**Methods**

**Implementation**
The package is written in Bash and Python (3+), and is built to run in a Unix-like environment.

**Operation**

*bit* is packaged in conda, which serves as its primary means of installation. All dependencies are handled by the conda installation, but they include: python v3+; biopython v1.7.9+; pybedtools v0.8.2+; GNU parallel v20211022+; pandas v1.3.4+; entrez direct v16.2+; taxonkit v0.9.0+; goatools v0.8.12.

**Use cases**

All commands are prefixed with ‘bit-’ and so can be seen by typing that and hitting tab twice. Each comes with a help menu by running the command with no arguments or with ‘-h’. In Figure 1 is an example with the program for downloading genome assemblies from NCBI by providing accessions.

**Software availability**

Source code available from: https://www.github.com/AstrobioMike/bit.

Archived analysis code as at time of publication: https://doi.org/10.5281/zenodo.3383647.

License: GNU GPL v3.0.

The author has put some effort to compile a set of useful scripts. By looking at the number of references alone, it is clear the author lacks knowledge in the field of bioinformatics as many works are left out or not even mentioned. Aside from this fact, there is no description of the methodologies that are made available. I would invite the author to see what a normal methods section looks like. Although a practical set of scripts is provided and for the most part well written, there is a fundamental gap in describing and reproducing this work. Moreover, I would invite the author to look up relevant and openly available data sets where use cases can be presented and the usefulness can be demonstrated. In its current state, there is need for more than considerable work to improve this submission.

Is the rationale for developing the new software tool clearly explained?
No

Is the description of the software tool technically sound?
No

Are sufficient details of the code, methods and analysis (if applicable) provided to allow replication of the software development and its use by others?
No

Is sufficient information provided to allow interpretation of the expected output datasets and any results generated using the tool?
No

Are the conclusions about the tool and its performance adequately supported by the findings presented in the article?
Competing Interests: No competing interests were disclosed.

Reviewer Expertise: Bioinformatics, Artificial Intelligence, Machine Learning, Data Mining, Data Visualization

I confirm that I have read this submission and believe that I have an appropriate level of expertise to state that I do not consider it to be of an acceptable scientific standard, for reasons outlined above.

The author reports a collection of scripts for various bioinformatics tasks. However, the manuscript is too short and lacks important details for me to assess the significance and novelty of this work. The rationale for this study is unclear. The description of the tool is not enough. I suggest the author add more details to the Methods section and perform a thorough comparison with related tools/packages.

Specific comments:

Need to be more clear about the problems or tasks that this toolkit tries to address. How efficient are these scripts? What are the expected input sizes for your scripts? Have you done any comparison with other similar packages?

Is the rationale for developing the new software tool clearly explained?
No

Is the description of the software tool technically sound?
No

Are sufficient details of the code, methods and analysis (if applicable) provided to allow replication of the software development and its use by others?
Partly
Is sufficient information provided to allow interpretation of the expected output datasets and any results generated using the tool?
No

Are the conclusions about the tool and its performance adequately supported by the findings presented in the article?
No

**Competing Interests:** No competing interests were disclosed.

**Reviewer Expertise:** Bioinformatics, single-cell genomics

I confirm that I have read this submission and believe that I have an appropriate level of expertise to state that I do not consider it to be of an acceptable scientific standard, for reasons outlined above.

The benefits of publishing with F1000Research:

• Your article is published within days, with no editorial bias
• You can publish traditional articles, null/negative results, case reports, data notes and more
• The peer review process is transparent and collaborative
• Your article is indexed in PubMed after passing peer review
• Dedicated customer support at every stage

For pre-submission enquiries, contact research@f1000.com
